Live with Heart

Sigma Kappa: Epsilon Omega Chapter Sorority Member Retention Process Improvement

1.20.2026 - 3.10.2026

Prepared By:

Natalie Storz nsstorz@calpoly.edu 916.701.7317

* This report may be used as an example for future lean six Sigma classes. It may also be used in whole or part in research publications with proper attribution.*

Introduction

Project Description:

- This project focuses on improving member retention within the Sigma Kappa Epsilon Omega Chapter. The objective is to strengthen engagement, communication, and support throughout the sorority member lifecycle in order to increase retention from initiation through senior year. Using the DMAIC methodology, this project aims to identify root causes of member attrition and implement data-driven improvements that enhance the overall member experience and chapter stability.

Project Statement:

- Currently, retention from initiation through senior year within the Sigma Kappa Epsilon Omega Chapter is approximately 80%, resulting in a 20% attrition rate prior to graduation. This attrition disrupts leadership continuity, increases recruitment and onboarding demands, and negatively impacts overall chapter stability.

Sponsoring Organization:

- The sponsoring organization for this project is Sigma Kappa, Epsilon Omega Chapter. Sigma Kappa is a collegiate sorority dedicated to fostering lifelong sisterhood, leadership development, academic excellence, and community involvement. The Epsilon Omega Chapter seeks to maintain a strong, engaged membership base to ensure sustainable leadership and a positive member experience.

Sponsoring Champion:

- The Project Champion is Giulia Padoan, Sorority President. As chapter president, she has authority over membership processes and strategic initiatives and is responsible for supporting the implementation of improvements resulting from this project. Her leadership ensures alignment between the project objectives and the chapter's long-term goals.

Giulia Padoan - gpadoan@calpoly.edu - 925.765.7257

Executive Summary

Sigma Kappa Epsilon Omega Chapter is a collegiate sorority committed to fostering leadership development, academic success, and lifelong sisterhood. Sustained membership engagement is critical to maintaining chapter stability, leadership continuity, and financial health. Currently, retention from initiation through senior year is approximately 80%, meaning 20% of initiated members become inactive prior to graduation. This level of attrition increases recruitment burden, weakens the leadership pipeline, and impacts overall member experience.

The root problem of this issue lies within the member lifecycle process, specifically in engagement, communication, and structured support systems across academic years. While members join with enthusiasm, inconsistencies in ongoing engagement and unclear expectations can contribute to disengagement over time.

Through the application of the DMAIC methodology, this project evaluated baseline retention data, gathered member feedback, and analyzed patterns contributing to attrition. Root cause analysis revealed that gaps in consistent communication, limited structured follow-up, and variability in member involvement experiences were significant contributors to declining retention. Logistic regression analysis confirmed that communication clarity significantly predicts retention ($p = 0.002$).

To address these issues, this project developed standardized engagement checkpoints, clearer communication practices, and defined retention metrics to monitor member experience over time. A control plan was established to ensure improvements are sustained and measurable.

Recommendations

From an analysis of the current member lifecycle process, identification of root causes, and input from the Chapter President, I have a few recommendations.

1. Implement Structured Member Engagement Checkpoints
 - a. Establish scheduled one-on-one check-ins at key lifecycle stages (new member, sophomore year, junior year).
 - b. Create a standardized discussion guide for executive board members conducting check-ins.
 - c. Track engagement trends to identify early signs of disengagement.
2. Standardize Communication Expectations
 - a. Develop a clear communication calendar outlining key deadlines, expectations, and chapter events.
 - b. Clarify role expectations for members at each academic level.
 - c. Utilize one centralized communication platform to reduce confusion and information overload.
3. Establish Retention Metrics and Monitoring
 - a. Track retention by class year and leadership involvement.
 - b. Conduct short semester-based engagement pulse surveys.
 - c. Review retention data at executive board meetings each term.

Elevator Speech

Hi, my name is Natalie Storz, and I completed a Lean Six Sigma project for the Sigma Kappa Epsilon Omega Chapter focused on improving member retention.

Currently, our retention from initiation through senior year is about 80%, meaning 20% of members become inactive before graduation. That attrition affects leadership continuity, increases recruitment pressure, and impacts overall chapter stability. So I wanted to understand why this was happening and how we could improve it in a structured way.

First, I measured retention data by class year and gathered member feedback. I found that the biggest drop occurs between sophomore and junior year, and communication clarity was one of the most common concerns.

Then, I analyzed whether communication actually impacted retention. Statistical analysis showed that clearer communication significantly increased the likelihood of members staying active.

Based on those findings, I implemented structured engagement checkpoints, standardized communication expectations, and created measurable retention metrics.

What I learned is that retention isn't just about culture — it's about process. When engagement and communication are managed intentionally and measured consistently, we can create long-term chapter stability.

DEFINE

TOOL 1: Project Charter

PROJECT CHARTER

Project Name: (1) Sorority Member Retention Improvement	Business/Location: (2) Sigma Kappa Epsilon Omega Chapter
Team Leader: (3) Natalie Storz (916) 701.7317	Champion: (4) Sorority President: Giulia Padoan (925) 765.7257
Project Description/Mission: (5) This project aims to improve retention stability within the Sigma Kappa Epsilon Omega Chapter by addressing communication clarity and lifecycle engagement gaps. The focus is on reducing attrition risk, particularly during the sophomore-to-junior transition, through structured communication processes and standardized engagement checkpoints.	
Problem Statement: (6) Approximately 20% of initiated sorority members are no longer active by their senior year, with the most significant decline occurring during the sophomore-to-junior transition, indicating instability within communication and lifecycle engagement processes.	
Business Case: (7) Consistent member retention is critical to maintaining chapter stability, leadership continuity, and financial sustainability. Attrition increases recruitment burden, weakens leadership development, and negatively impacts member experience. Improving communication clarity and engagement consistency reduces long-term retention risk and strengthens chapter performance.	
Deliverables: (8) Documented current-state member lifecycle process Mini-project report Identified root cause of member attrition Retention improvement recommendations Defined retention metrics and control plan	Goals/Metrics: (9) Communication clarity survey score (target ≥ 8.0) Retention percentage by class year Junior check-in completion rate (target ≥ 90%) Communication platform compliance (target 100%) Attendance policy compliance (target ≥ 90%)
Process & Owner: (10) Sorority Member Lifecycle & Vice President of Membership Recruitment	
Project Scope Is: (11) Communication calendar standardization Communication platform consolidation Officer transition documentation Junior-year engagement checkpoints Attendance policy consistency Project Scope Is Not: National policy revisions Recruitment marketing redesign Alumni engagement programming	
Key Customers: (12) Active and future sorority members Executive Board Leadership	Expectations: (13) Improved member experience Increased retention through senior year Greater chapter stability

Milestones: (14)		Completion Dates: (15)	
Project Start:	1/6/2026		
	Define Phase	1/20/2026	
	Measure Phase	2/3/2026	
	Analyze Phase	2/17/2026	
	Improve Phase	3/3/2026	
	Control Phase	3/10/2026	
Project Completion:	3/10/2026		
Expected Business Benefits: (16)		Quantify	
		1-Time	Annual
	Hard Cost		
	Soft Cost		reduced member turnover rate
	Revenue		Increased retention maintains annual dues contribution
	Speed		
	Compliance		
	Intangible		
		Explanation	
		Soft Cost: Reduced recruitment burden and leadership transition strain due to improved retention stability	
		Revenue: Improved retention leads to sustained dues revenue and increased financial stability for chapter programming	
Team Members: (17)			
Natalie Storz, Giulia Padoan, Shannon (chapter advisor), Abby Abrahamson			
Expected Resource Needs (Internal/External): (18)			
Access to membership records			
Member survey tool			
limited time commitment from chapter leadership			
Risk Assessment: (19)			
Limited historical data			
Leadership turnover during implementation period			
Resistance to change			
Prepared By: (20)		Date (Last Revision): (21)	
Natalie Storz		3/10/26	

WHY?

The Project Charter was selected as the first tool in the Define phase because it establishes the foundation and direction of the entire DMAIC process. In Lean Six Sigma methodology, the Define phase clarifies the problem, scope, stakeholders, and measurable objectives before moving into data collection and analysis. This tool ensured that the project remained focused on improving the member lifecycle process rather than proposing premature solutions. It also clarified project boundaries, including what was within scope such as engagement, communication, and support processes, and what was outside scope, such as national policy changes or recruitment marketing redesign. Establishing this structure early prevented scope creep and aligned the project with the chapter's strategic objectives.

INTERPRETATION

The Project Charter revealed that member attrition is not simply an isolated engagement issue, but a measurable process gap impacting leadership continuity, recruitment workload, and overall chapter sustainability. By formally documenting the problem statement, business case, stakeholders, and milestones, the charter provided a clear roadmap for proceeding through the remaining DMAIC phases. One key insight gained from completing the charter was the

importance of defining measurable retention metrics before exploring potential causes. Without a clearly articulated baseline and target, analysis efforts could become unfocused. The charter reinforced the need to approach retention as a process performance issue rather than a cultural or motivational problem, which strengthened the analytical direction of the project moving forward.

DEFINE

TOOL 2: Affinity Diagram

Brainstorming Results:

Affinity Chart:

WHY?

The Affinity Diagram was used in the Define phase to clarify the problem by organizing initial member complaints into meaningful categories. This tool helped group related concerns and identify patterns that define the scope of the problem before proceeding to measurement and analysis. Because retention is a long-term behavioral outcome rather than a single transactional process failure, it was more important to first structure qualitative feedback before mapping inputs and outputs. The Affinity Diagram helped define the problem space prior to formal process mapping.

INTERPRETATION

The Affinity Diagram revealed five recurring themes: communication clarity, workload balance, sense of belonging, perceived value, and leadership consistency. Rather than viewing attrition as isolated dissatisfaction, the grouped complaints indicate broader process-related concerns. This insight helped refine the project focus to engagement, communication, and support systems within the member lifecycle. By clarifying these problem categories early, the project established a structured foundation for targeted measurement in the next phase.

MEASURE

TOOL 3: Pareto Chart

WHY?

A Pareto Chart is used to prioritize problem categories by displaying them in descending order of frequency, helping identify the “vital few” drivers contributing most to an issue. In the Measure phase, this tool is appropriate because it quantifies and ranks the primary themes identified in the Define phase, allowing data to guide focus rather than assumptions. I selected the Pareto Chart because it transforms qualitative member feedback into measurable priorities, ensuring improvement efforts target the highest-impact drivers.

DATA:

Results

	Number of Complaints	Cumulative Number of Complaints	Percentage	Cumulative Percentage
Communication Clarity	4	4	25	25
Perceived Value	4	8	25	50
Leadership Consistency	3	11	18.75	68.75
Time & Workload	3	14	18.75	87.5
Belonging	2	16	12.5	100

GRAPH:

*Complaint frequencies were derived from the member feedback collected during the brainstorming and affinity diagram exercise.

INTERPRETATION

The Pareto analysis showed that communication clarity and leadership consistency were the most frequently reported drivers of disengagement, together accounting for half of the identified complaints. This added measurable prioritization to the project by distinguishing the most significant contributors to attrition from less frequent concerns. Instead of treating all issues equally, the results allowed the project to focus on the highest-impact process gaps influencing retention. This prioritization strengthened the analytical direction of the project and provided clear guidance for the subsequent Analyze and Improve phases.

MEASURE

TOOL 4: Bar Chart

WHY?

A Bar Chart is used to compare categorical data visually, allowing differences between groups to be easily identified. In the Measure phase, this tool is appropriate because it quantifies retention performance across each class level and highlights where membership declines occur within the lifecycle. I selected the Bar Chart because it provides a clear and straightforward comparison of class-level membership distribution, making performance gaps immediately visible. This visualization establishes a measurable baseline and helps direct analytical focus toward the class transition with the greatest decline.

INTERPRETATION

The Bar Chart shows a clear decline in membership distribution as class level increases, with the most significant reduction occurring between sophomore and junior year. While freshman and sophomore membership levels remain relatively strong, junior-year representation drops noticeably, indicating a potential transition risk point within the member lifecycle. This suggests that attrition is not evenly distributed but concentrated during a specific stage of membership. Identifying this pattern provides direction for deeper analysis into the engagement, workload, and leadership factors that may be contributing to junior-year disengagement.

ANALYZE

TOOL 5: Logistic Regression

WHY?

Logistic Regression is used to examine the relationship between one or more predictor variables and a binary outcome. In the Analyze phase, this tool is appropriate because the dependent variable (retention status) is binary (active vs inactive), and it allows statistical evaluation of how communication clarity influences the likelihood of remaining active. I selected Logistic Regression to move beyond visual trends and determine whether communication clarity significantly predicts retention outcomes. This analysis provides quantitative validation of a key driver identified in earlier phase. The data was collected by asking current and past members of my sorority to rank the communication clarity from leadership figures, such as those on the executive board.

Estimated Response Model

	Coefficients	S.E.	Z	p-value	Lower 95% CI	Upper 95% CI
(intercept)	-0.733	0.4581	-1.6	0.1096		
CommunicationClarityScore	0.2119	0.0687	3.085	0.002	0.0773	0.3466

Final Model Information

Final Model $\text{logit}(\text{RetentionStatus}) = (-0.733) + (0.2119) * (\text{CommunicationClarityScore})$

	Odds Ratio	Lower 95% CI	Upper 95% CI
CommunicationClarityScore	1.236	1.08	1.414

A hypothesis test was conducted to determine whether communication clarity significantly predicts member retention.

H₀: Communication clarity has no relationship with retention status.

H₁: Communication clarity significantly predicts retention status.

With a p-value of 0.002 (<0.05), the null hypothesis is rejected, indicating that communication clarity significantly influences retention.

The dataset included responses from 276 past and current Sigma Kappa members who rated communication clarity on a standardized scale 1-10 (10 being great and 1 being bad), as well as their member status (1 for active and 0 for inactive).

INTERPRETATION

Logistic regression analysis indicates that communication clarity is a statistically significant predictor of retention status ($p = 0.002$). The positive coefficient ($\beta = 0.2119$) suggests that higher communication clarity increases the likelihood of remaining active. The odds ratio of 1.236 indicates that for every one-point increase in communication clarity score, the odds of remaining active increase by approximately 23.6%, holding other factors constant. As a result, improving communication clarity represents a high-impact opportunity to reduce attrition risk in subsequent lifecycle stages.

ANALYZE

TOOL 6: Fishbone Diagram

WHY?

The Fishbone Diagram was used in the Analyze phase to systematically identify potential root causes contributing to declining member retention across the sorority lifecycle. While earlier analysis revealed that retention decreases most significantly during the sophomore-to-junior transition and that communication clarity significantly predicts retention outcomes, it was necessary to explore the broader systemic factors influencing this decline. The Fishbone structure organizes possible causes into People, Process, Equipment, Management, Environment, and Materials, ensuring that analysis extends beyond individual behavior and considers organizational and structural contributors. This tool was selected to support deeper root cause identification before moving into solution development.

INTERPRETATION

The Fishbone analysis revealed that retention instability is influenced by multiple interrelated factors, particularly inconsistencies in communication processes, leadership transitions, and lack of standardized engagement checkpoints. Process-related causes, such as the absence of a formal communication protocol and unclear attendance expectations, emerged as significant contributors. Additionally, management factors such as inconsistent enforcement of policies and limited lifecycle monitoring may exacerbate attrition risk. This analysis reinforces that declining retention is not the result of a single issue, but rather a combination of systemic process gaps that must be addressed holistically in the Improve phase.

IMPROVE

TOOL 7: Failure Modes and Effects Analysis (FMEA)

WHY?

Failure Modes and Effects Analysis (FMEA) is used to identify potential process failures and prioritize corrective actions based on severity, occurrence, and detection ratings. In the Improve phase, this tool is appropriate because it ensures that solutions target the highest-risk failure modes identified during analysis rather than isolated symptoms. I selected FMEA to systematically evaluate communication and lifecycle engagement breakdowns and determine which issues pose the greatest threat to retention stability. This approach ensures that improvement efforts are data-driven, prioritized, and focused on reducing the most critical risks within the member lifecycle process.

FMEA:

Process Step	Failure Mode	Severity	Occurrence	Detection Probability	Risk Priority Number
Communication of weekly expectations	deadlines are unclear	8	7	7	392
Executive Board Communication	multiple communication platforms	7	8	6	336
Leadership Transition	Inconsistent officer turnover communication	7	6	8	336
Junior-Year Engagement	No checkpoints during the year	9	6	8	432
Policy enforcement	inconsistently enforced rules	6	6	7	252

Action to Improve	Revised Severity	Revised Occurrence	Revised Detection	Revised Risk Priority Number
Enforce a calendar like Google Calendar	8	3	3	72
Adopt a singular communication platform (GroupMe)	7	3	4	84
Annual officer transition meetings	7	3	4	84
Junior year check-ins with executive board	9	3	3	81
Document Attendance Policies on OurHouse	6	3	3	54

INTERPRETATION

The FMEA results indicate that the highest-risk failure modes within the member lifecycle process were unclear communication expectations and the absence of structured junior-year engagement checkpoints. These failure modes produced the largest Risk Priority Numbers (RPNs), signaling that they posed the greatest threat to retention stability. Following implementation of standardized communication protocols, centralized platforms, leadership transition procedures, and structured junior-year check-ins, the revised RPN values decreased substantially. This reduction demonstrates that the proposed improvements meaningfully lower both the likelihood of process breakdown and the risk of undetected disengagement, positioning the chapter for more stable long-term retention outcomes.

IMPROVE

TOOL 8: Corrective Action Matrix

WHY?

Although the FMEA identified which failure modes posed the greatest risk to retention, it did not specify when or how those corrective actions would be executed. I incorporated a Corrective Action Matrix because an improvement plan is only effective if actions are implemented within a defined timeline and assigned to clear ownership. While identifying solutions such as standardizing communication and implementing junior-year check-ins is important, those changes must be structured, scheduled, and monitored to ensure follow-through. I used this tool to align each corrective action with specific due dates and responsible leaders, ensuring that improvements occurred within the project's January–March timeline and did not remain theoretical recommendations.

Team Name	Sigma Kappa Epsilon Omega Chapter	Revision
Team Leader	Natalie Storz	
Date	3/10/26	

Reference Number	Action	Person Responsible	Target Date	Effectiveness	Current Status
1	Publish a Google Calendar with due dates and attendance expectations	Director of Internal Operations: Brooke Abrahamson (925) 3146519	January 20th, 2026	70%	Completed
2	Adopt GroupMe as the communication platform	Director of Internal Operations: Brooke Abrahamson (925) 3146519	January 27th, 2026	65%	Completed
3	Create Officer Transition Checklists	President: Giulia Padoan	February 10th, 2026	60%	Completed
4	Junior- Year check-in meetings	President: Giulia Padoan	February 24, 2026	75%	Completed
5	Attendance Guidelines and updates on OurHouse	President: Giulia Padoan	3/3/26	55%	Completed
6	Monthly Retention Review	President: Giulia Padoan	March 10th, 2026	50%	In Progress

INTERPRETATION

Storz, ITP Mini Project

The Corrective Action Matrix demonstrates that prioritized improvements were implemented systematically throughout the quarter, beginning in early January and concluding in March. High-impact actions, such as standardizing the communication calendar and centralizing communication platforms, were executed early to immediately reduce occurrence and confusion-related failures. Mid-quarter initiatives, including officer transition protocols and junior-year engagement check-ins, addressed systemic instability identified in the Analyze phase. The assigned effectiveness percentages reflect the estimated reduction in failure risk based on FMEA scoring, showing meaningful improvement in process consistency and detection capability prior to project closeout.

CONTROL

TOOL 9: Control Plan

WHY?

A Control Plan was implemented to ensure that improvements made during the Improve phase are sustained beyond the duration of the project. While corrective actions such as standardizing communication and implementing junior-year check-ins reduce immediate risk, ongoing monitoring is necessary to prevent regression. This tool defines measurable specifications, assigns monitoring responsibility, and establishes corrective responses if performance declines. By formalizing retention and communication oversight, the Control Plan ensures long-term process stability.

Organization	Omega Chapter	Key Contact	Natalie Storz	Date (Orig)	3/10/26
Location	San Luis Obispo, CA	Phone	9167017317	Date (Rev)	3/11/26
Email	nsstorz@calpoly.edu	Revision #	1		

Part or Process Number	Process Name or Operation Description	Input	Output	Characteristic	Measurement Method	Measurement Specification	Sample Size	Sampling Frequency	Corrective Action
1	Communication Calendar Management	Semester Deadlines and attendance requirements	clear and consistent communication	communication clarity	Member survey (1-10)	average score $\Rightarrow$ 8	100% of active members	end of each semester	Review calendar format and revise communication SOP if score < 8
2	Communication platform standardization	official announcements	Reduced message confusion	Platform Consistency	Platform Audit	100% of announcements posted on designated platform	all executive communications	monthly	Reinforce platform policy and retrain officers
3	Junior-Year Engagement Check Points	Member Participation Data	early disengagement detection	check-in completion rate	attendance log	100% of Juniors receive 1 check-in per year	all Junior members	each calendar year	schedule additional follow ups for missed check-ins
4	Attendance Policy Enforcement	Member Attendance Records	Consistent Policy Enforcement	Policy compliance rate	attendance audit	90% policy compliance	all active members	monthly	Incorporate fines for missing mandatory events
5	Retention Monitoring	Class-level membership data	stable retention rates	Retention % by class year	membership roster review	no significant drop between class levels	entire chapter	end of each quarter	conduct engagement interventions

INTERPRETATION

The Control Plan ensures that improvements implemented during the Improve phase are sustained beyond the duration of the project. Each control measure directly aligns with previously identified risk areas, including communication clarity, platform consistency, junior-year engagement, and retention stability. By defining measurable standards, monitoring

frequency, and specific corrective actions, the plan creates a structured system that does not rely on informal oversight or individual leadership styles.

The plan incorporates both process controls (such as communication audits and junior check-ins) and outcome controls (retention by class year), allowing the chapter to detect early warning signs before attrition increases. If performance falls below defined thresholds, predefined corrective actions ensure timely intervention. Overall, the Control Plan formalizes accountability and establishes a sustainable feedback loop to maintain consistent communication practices and long-term retention stability.

CONTROL

TOOL 10: Project Closeout

WHY?

The Project Closeout tool was used in the Control phase to formally evaluate whether the objectives established in the Define phase were achieved within the project timeline. While improvements were implemented during the Improve phase, it is critical to assess whether those actions produced measurable results aligned with the original goals. I selected this tool to compare target performance metrics against actual outcomes and to determine the overall effectiveness of the retention improvement strategy. This final evaluation ensures accountability, highlights areas of success, and identifies any remaining gaps requiring continued monitoring.

Date	3/10/26	Project Manager	Natalie Storz	Contact Info
Project Name	Sorority Member Retention Improvement	Project Sponsor	Giulia Padoan	
Project Description	Improve retention stability by addressing communication	Customer Contact	925.765.7257	Contact Info

Requirement	Description of how the requirement is measured	Target	Value	Date
Calendar Implementation	Average member survey score (1-10)	=>8.0	8.3	3/8/26
Adopt GroupMe	% of announcements posted	100% compliance	95% compliance	3/5/26
Implement Junior Year Check Ins	% of Junior members completing check-in	100%	92%	3/7/26
Monitor Retention Stability	% retained from sophomore to junior year	no drop greater than 5%	4%	3/9/26
Attendance Policy Consistency	%compliance with documented policy	>=90%	93%	3/8/26
Executive Monitoring Adoption	Monthly retention review added to agenda	implemented	implemented	3/10/26

INTERPRETATION

The Project Closeout results indicate that the majority of targeted improvements were successfully implemented within the quarter timeline. Communication clarity scores improved

beyond the defined target, supporting the statistical findings from the Analyze phase. Junior-year check-ins and standardized communication practices were largely adopted, reducing variability in engagement processes. While minor gaps remain in full platform compliance and check-in completion, overall performance metrics suggest meaningful improvement in retention stability and communication consistency. Continued monitoring through the Control Plan will support sustained gains beyond the project period.
